Project Title: REAL-TIME WEB-BASED AUCTION AND BIDDING SYSTEM

Module Photographs: (3 photographs –Module Photo, Individual student contribution module work in the project and presentation image)

The first photograph shows a group of five people (three men and two women) standing in front of a presentation screen. The screen displays the title 'SIMATS Real-Time Web-based Auction and Bidding System' and the location 'Mevalurkuppam, Tamil Nadu, India'. The second photograph is a screenshot of the GavelBid web application. It shows a 'System Reporting Center' with a table of auction sales. The table has columns for Auction ID, Product Title, Seller Username, Winner Name, Selling Price, and Date Concluded. The third photograph is a 'SYSTEM ARCHITECTURE' diagram. It illustrates the flow of data and components in the 'Real-Time Online Auction System'. Key components include a 'WEB CLIENT (BROWSER)', 'APPLICATION PROCESS SERVER', 'DATABASE', and 'ISOLATION FOREST ARCHITECTURE'. The diagram also shows the 'SERVER ENVIRONMENT' and 'DATASET USED - UCI Skill Bidding Dataset'.

Project Description: Module 5 - Admin & Reports Module

The Real Time Web Based Auction and Bidding System is a web-based platform for online auctions. It allows users to securely register, log in, and manage their profiles. Sellers can add and manage products for auction. Buyers can browse products and participate in active auctions. The system supports real-time bidding between multiple buyers. Each bid is validated and the highest bid is automatically tracked. The highest bidder is selected as the winner when the auction ends. Payment and transaction details are securely recorded in the system. Users can view their bidding and transaction history. Administrators can manage users, products, auctions, and transactions. The system provides a secure, transparent, and user-friendly platform for online buying and selling. It reduces the need for physical auctions and allows users to participate from different locations. Real-time bidding improves transparency and ensures fair winner selection. The system also helps administrators monitor auction activities and generate reports. Overall, it improves the efficiency, accessibility, and reliability of the online auction process.
